| <p>1. None of the cited documents disclose all the features of claims 1 to 8. The subject matter of these claims is therefore novel.</p> <p>2. The closest prior art is described in DE-A-10 032 179. The problem with the prior art control system is that the actuators in all the sub-systems are controlled from the co-ordination level. This means there are relatively long signal paths, resulting in unnecessarily long control times for vehicle axle-specific elements.</p> <p>3. As a solution to this problem the application proposes connecting an axle electronics module to the co-ordination level. The module is located near the vehicle axle and controls the brake actuator and the controllable differential lock.</p> <p>This shortens the wiring paths and reduces the networking complexity and the control times.</p> <p>4. The idea of adopting these features in the control system known from DE-A-10 032 179 does not seem</p> | | | |
